1. Introducción

En este proyecto, vamos a construir una máquina CNC sencilla para dibujar el logo de la Universidad Autónoma de Ciudad Juárez (UACJ) sobre papel. Usaremos motores a paso para mover un lápiz, pluma o marcador con precisión, controlados por una placa Arduino y configurado con el respectivo Firmware Marlin.

2. Objetivos

Diseñar y construir una máquina CNC controlada mediante Arduino y el firmware Marlin, capaz de dibujar de forma autónoma el logotipo de la UACJ sobre papel, utilizando dos motores paso a paso para los ejes x y y , y un servomotor para el eje z .

2.1. Objetivos particulares

- Diseñar la estructura mecánica de la CNC, garantizando estabilidad y precisión.
- Implementar el control de motores paso a paso mediante Arduino.
- Configurar el sistema utilizando el firmware Marlin.
- Generar código G a partir de un diseño en Inkscape.
- Probar y calibrar la máquina para asegurar su correcto funcionamiento y precisión.

3. Marco Teórico

3.1. ¿Qué es una máquina CNC?

El CNC (Control Numérico Computarizado por sus siglas en ingles) es un sistema automatizado de máquinas que trabajan con comandos o funciones programados, cuyas instrucciones son guardadas en un disco de almacenamiento. Es una máquina herramienta utilizada para:

- Maquinar piezas de diversos materiales.
- Proceso automatizado.
- Programación de computadora.
- Control por computadora.

4. Requisitos

4.1. Hardware

4.1.1. Microcontrolador

Figura 1: WeMos Mega WiFi R3 ATmega2560 + ESP8266 32MB.

El Arduino es una placa electrónica de código abierto basada en un microcontrolador reprogramable. Está diseñada para facilitar el desarrollo de proyectos electrónicos mediante la conexión de diversos sensores, actuadores y otros dispositivos a través de sus pines de entrada y salida digitales y analógicas.

4.1.2. Placa de expansión

Figura 2: Ramps 1.6.

La placa de expansión **Ramps 1.6** está diseñada para ser montada sobre un **Arduino Mega 2560**. Su principal función es facilitar la conexión y el control de hasta cinco motores paso a paso de forma independiente, correspondientes a los ejes X, Y, Z y a dos extrusores (E0 y E1). Esta placa es comúnmente utilizada en impresoras 3D y máquinas CNC, ya que permite integrar drivers como los **A4988** o **DRV8825**, además de otros componentes como interruptores, ventiladores y termistores.

4.1.3. Motor a pasos

Figura 3: 17HD48002H-22B.

Es un motor pasos tipo **NEMA 17**, ideal para aplicaciones de precisión como máquinas CNC. Ofrece un ángulo de paso de 1.8° (200 pasos por revolución) y funciona con una corriente de 1.5 A por fase. Su tamaño compacto y buen par de torsión lo hacen adecuado para mover los ejes x , y y z del proyecto con alta precisión.

4.1.4. Servomotor

Figura 4: SG90.

El servomotor SG90 es uno de los más versátiles y comúnmente utilizados en proyectos de robótica gracias a su tamaño compacto y buen rendimiento.

4.1.5. Pantalla de visualización

Figura 5: RepRapDiscount 12864.

Es un módulo completo que incluye una pantalla LCD de matriz de puntos de 128×64 píxeles, un lector de tarjetas SD y un codificador rotatorio (encoder). Este dispositivo permite controlar una impresora 3D o máquina CNC de forma autónoma, sin necesidad de una computadora, mostrando información del proceso y facilitando la navegación por el menú del firmware.

4.1.6. Drivers

Figura 6: DRV8825.

El driver DRV8825 es un controlador de motor paso a paso bipolar, que se utiliza para controlar motores paso a paso, especialmente en aplicaciones que requieren alta precisión y resolución de movimiento, como impresoras 3D y máquinas CNC.

4.1.7. Fuente de alimentación regulable

Figura 7: Korad KD3005D.

La fuente de alimentación **Korad KD3005D** es un instrumento versátil diseñado para diversas aplicaciones electrónicas. Cuenta con una velocidad de voltaje ajustable de hasta 30V y una corriente máxima de 5A.

4.2. Software

4.2.1. Marlin Firmware

Figura 8: Marlin Firmware.

Marlin es un firmware de código abierto muy usado para controlar impresoras 3D, máquinas CNC, grabadores láser y plotters. Se encarga de interpretar comandos G-code y convertirlos en movimientos físicos, controlando motores, servos y sensores. Es compatible con placas como RAMPS o SKR, y permite configurar fácilmente parámetros como ejes, límites y servomotores.

4.2.2. PlatformIO

Figura 9: PlatformIO.

PlatformIO es un entorno de desarrollo de código abierto que se usa con Visual Studio Code para programar microcontroladores. Permite compilar y cargar firmware como Marlin de forma rápida y organizada.

4.2.3. VSCode

Figura 10: VSCode.

Visual Studio Code (VS Code) es un editor de código ligero y multiplataforma desarrollado por Microsoft. Es muy usado por programadores gracias a su rapidez, personalización y soporte para extensiones.

4.2.4. Inkscape

Figura 11: Inkscape.

Inkscape es un software de diseño gráfico vectorial de código abierto, utilizado para crear y editar imágenes en formato SVG.

4.2.5. Pronterface

Figura 12: Pronterface.

Pronterface es una interfaz gráfica del programa Printron, usada para controlar impresoras 3D y máquinas CNC desde una computadora. Permite enviar comandos G-code, mover los ejes, controlar la temperatura (en impresoras 3D) y monitorear el estado de la máquina en tiempo real.

5. Implementación

5.1. Estructura

Se contaba con una estructura ya construida de madera prensada, la cual fue adaptada según las necesidades que surgieron durante el desarrollo del proyecto. En particular, se realizaron modificaciones en los ejes y se cambió la disposición de los motores dentro de la estructura.

Figura 13: Kit Mini CNC Plotter.

5.2. Ensamble de los motores

Se realizó el diseño de la estructura en **Solidworks** de acuerdo con la estructura solicitada.

Figura 14: Diseño de SolidWorks.

5.3. Diagrama pictórico

Se elaboró un diagrama que representa las conexiones del proyecto, mostrando de manera visual cómo están interconectados los componentes utilizados.

Figura 15: Diagrama realizado en fritzing.

5.4. Prueba y conexión de los motores

Después de generar el código G, se realizó una prueba con los motores a paso **NEMA 17**. Con el uso del controlador **RepRapDiscount**, fue posible iniciar y detener el trabajo directamente desde la tarjeta SD. Además, este controlador permite ajustar de forma sencilla parámetros como la posición y la velocidad de los motores.

Figura 16: Conexiones de los motores con Ramps 1.6.

5.5. Generación del código G

Durante el proyecto se utilizó el software **Inkscape** para diseñar gráficos en formato vectorial. Luego, con ayuda de la extensión **J Tech Photonics Laser Tool**, convertimos esos diseños en código G, el cual puede ser interpretado por el controlador gráfico inteligente **RepRapDiscount 12864**. Este controlador trabaja junto con motores a paso y el firmware **Marlin**, permitiendo que los motores realicen los movimientos necesarios para el grabado de forma precisa.

En la parte inferior se define el *offset*, que corresponde a la diferencia de distancia entre el interruptor de límite y la punta de la herramienta (en este caso, una pluma).

Figura 17: Extensión de herramienta laser para Inkscape.

5.6. Interfaz gráfica Pronterface

Se usó la herramienta **Pronterface**, la cual nos ayuda a manipular en tiempo real nuestra máquina CNC, usualmente usada en aplicaciones de impresoras 3D, ya que cuenta con calibración de extrusores y demás herramientas con las que el CNC convencional no cuenta.

Figura 18: Interfaz de usuario Pronterface.

6. Resultados

En este proyecto se nos pidió construir una máquina capaz de dibujar el logotipo de nuestra universidad sobre una hoja de papel. Al principio, enfrentamos varios problemas relacionados con la estructura, la calibración de los motores, el ajuste del firmware Marlin y la conversión del diseño del logotipo a código G, para que la máquina pudiera interpretarlo correctamente.

Uno de los principales problemas fue encontrar la posición inicial correcta de los motores mediante el auto-homing. También tuvimos dificultades con el ángulo del servomotor encargado de subir y bajar la pluma, ya que al forzarlo demasiado se dañaban los engranajes, lo que impedía su correcto funcionamiento.

Después de varias pruebas, ajustes mecánicos y mejoras en el código, logramos que la máquina funcionara correctamente. Se logró trazar el logotipo con buena precisión, como se muestra en la Figura 19. Aunque aún hubo algunos detalles por corregir, el resultado general fue exitoso y se cumplió con el objetivo del proyecto.

Figura 19: Resultados.

Figura 20: Resultados.

7. Conclusión

Se obtuvo un resultado favorable, ya que se cumplió con el objetivo principal del proyecto: trazar el logotipo de nuestra universidad sobre una hoja de papel utilizando una máquina CNC. Para lograrlo, fue necesario calibrar correctamente los motores NEMA 17, ajustar el firmware, definir con precisión el punto de auto-homing y configurar el ángulo adecuado del servomotor.

Durante el proceso, integramos conocimientos de electrónica, programación y diseño mecánico, lo que nos permitió enfrentar y resolver distintos problemas técnicos. Este proyecto no solo nos permitió aplicar lo aprendido en clase, sino que también fortaleció nuestro trabajo en equipo y nuestras habilidades prácticas.
